## 2026 Energy Conspiracy: The Cycle That Resets Everything

1 message

### TL;DR

- ✓ The current market rally is artificial — fueled by monetary policy and political incentives.
  - ✓ A major correction is coming, followed by a new expansion cycle — but only for those prepared.
  - ✓ The 2026 “crisis” will have a dual narrative: **cyberattack + energy.**
  - ✓ Elon Musk and Starlink play a strategic role in the next financial architecture.
  - ✓ My goal: **80% cash before the reset**, ready to re-enter in 2026–2027.
- 

### 💡 The “Conspiracy” Theory – What It Really Means

*A conspiracy* is just an event that hasn't happened yet.

Every major crisis looks like a conspiracy — until it becomes history.

My analysis starts from visible signals — whether you call them “simulations,” “matrix patterns,” or simply **economic synchronizations**.

---

### Markets & Yields (Fed, SPX & Bonds)

The current **S&P 500 rally** looks eerily similar to the pandemic-era pump: fast, artificial, and unjustified by fundamentals.

The difference? This rally lasted **200 days**, compared to **484** during the previous one — which suggests a *violent correction* before the next true cycle begins.

Bond yields haven't yet shown the classic breakdown that signals real easing and a healthy *risk-on* environment.

Until that happens, everything is just a **controlled rebound**.

## Parallels with 2007 (GFC)

In 2007, the S&P 500 dropped **57%**.

Yet Amazon and Apple printed *higher lows* and led the recovery before the index did.

History rhymes.

In **2026**, I expect a major correction in **indices and Bitcoin**, but **small caps** (and select names like PYPL, FCEL, and other early movers) will signal the comeback first.

## Bitcoin & Altcoins

If the S&P falls 40%, Bitcoin could drop **up to 80%**.

My zone of interest: **\$49K–\$31K** — where all the leverage (ETFs, corporate treasuries) must be flushed out.

Solid altcoins — **IOTA, CRV, EGLD** — have already shaken off weak hands.

From here, we could see a short, explosive **Halfcoin Season**, followed by stagnation through **2026–2027**, and a new **major cycle** into **2028–2029**.

## 🦠 Pandemic 2.0 & The Energy Crisis

The pandemic came with **\$9 trillion printed**.

The next phase will require **\$20 trillion+**.

That means the narrative must be stronger:

**global cyberattacks, energy shortages, and partial blackouts.**

Just like in 2019, people are once again opening coffee shops and fast-food stands — a *classic* end-of-cycle symptom.

The next “event” will serve one purpose: **to divide the population again**, just like the pandemic did.

---

## **Elon Musk & Starlink – The Central Piece of the New System**

In **1921**, Henry Ford dreamed of a currency backed by energy.

Elon Musk is the modern version — with *global internet* included.

His positioning across **Tesla**, **Starlink**, **SpaceX**, **XAI**, and **Neuralink** isn't random.

**Starlink is the key.**

When local networks go dark, it'll be the only infrastructure still running — the network that keeps *communication* and

*value transfer* alive.

That's why it appears so often in "cyber-collapse" theories: it may be one of the only networks left online.

But there's a deeper layer no one's talking about:

**The U.S. needs the dollar to find new global users.**

Not all countries allow citizens to hold dollars — yet demand keeps rising.

The global banking system isn't fully interconnected, so the only scalable solution is **stablecoins**.

That's where the **supercycle** begins.

Musk — Trump's loudest amplifier — is clearly playing on the same team.

Through **Starlink**, the U.S. will be able to distribute *digital dollars* even to Africa or Latin America, bypassing local

banks and restrictive jurisdictions.

This will force new agreements between the U.S. and emerging markets with young populations — giving them direct access to dollars via **satellite internet**.

All it takes is a **digital wallet** and a **Starlink connection**.

The side effect?

Those nations will start buying **U.S. Treasuries** (like Tether does today), reinforcing demand for American debt — exactly when **China and Japan** have been unloading it since 2014.

When these pieces align, the **playbook for the next decade** is complete.

---

## us The U.S. Macro Playbook

America has one simple strategy:

- 1 Spike global demand** for dollars (DXY surge).
- 2 Print aggressively** and buy depreciated assets (crypto, tech, energy).
- 3 Devalue the dollar** afterward, inflating asset prices relative to the rest of the world.

The endgame?

To **fund and strengthen** its war machine ahead of **2035–2040**.

---

### **How I'm Preparing**

I've already started prepping for a **2026-style scenario**:

Backup batteries, generator, and Starlink for guaranteed internet access.

Gradual **exit from Bitcoin** (the market's biggest leverage).

Progressive **increase in cash exposure**.

My target: **80% out of the market** by the end of the 2025 Halfcoin Season.

Then, once the dust settles, I'll re-enter — **80% in BTC, ETH, and Tesla**.

Altcoins come later — **2027–2028**, when the market is fully cleansed.

## ✚ Conclusion

I'm preparing for a crisis **twice as severe as the pandemic**, but also for one of the **greatest opportunities** of my life.

I don't know *when* the event will strike — but I know *how* I want it to find me: **with liquidity, clarity, and zero panic.**

—

Cristian
